

Release Notes for SecureFM 11

Old and New Functions

When you look under 'External functions' in a calculation window, you will notice two sets of SecureFM functions. One set uses the familiar old format, like External ("Menu-Disable" ; parameter), and a nearly identical set of functions in the new format, like Menu_Disable (parameter). You do NOT need to change any old scripts or function calls that call the External () functions.

Both New and Old Function Formats Supported

There are now two sets of plug-in functions: the "old style" External () functions; and an identical list of the functions in the newer format, such as Menu_Disable, Menu_Rename, etc.

No change is necessary: SecureFM is backward-compatible. You do not need to update your older files to accommodate the new style functions. SecureFM still handles External () functions without a problem.

The new format functions are identical to the old External () functions in every way other than the format construction. A few examples of old and new format construction:

Old Format	New Format
External ("Menu-Disable" ; parameter)	Menu_Disable (parameter)
External ("Menu-Rename" ; parameter)	Menu_Rename (parameter)
External ("Menu-Script" ; parameter)	Menu_Script (parameter)
External ("Menu-HotKey" ; parameter)	Menu_HotKey (parameter)

The parameter used is the same for either old or new format construction.
